Highlights: These are the highlights.

Description of text extraction; raw data available on 4TU.ResearchData at…

Introduction

The research presented in this paper was prompted by the closure of the European post-Master of Urbanism (EMU) of the Department of Urbanism at the Faculty of Architecture and the Built Environment, TU Delft. The EMU was an advanced master ran jointly by TU Delft, KU Leuven, UPC Barcelona and Università IUAV di Venezia.

Distinctive features of the program:
- as a postmaster, it only accepted applicants with a prior MSc degree and experience in practice - provides a bridge towards PhD-level research - all students had an exchange semester at one of the other three program universities

In order to describe the legacy of the EMU program, including the distinctive features of its didactic approach, this paper aims to reveal the main topics taught in it and how those topics had evolved over the years of the program. To that end, we employed a text mining approach in which we analysed its output: 96 theses with an average of NaN words produced over the years for the duration of the program between 2007-2021.

This paper leverages topic modeling as an unsupervised machine learning method to reveal latent semantic structure and relationships between the latent topics in a large document collection (Muchene and Safari, 2021).

In Natural Language Processing (NLP) … and the focus on its subtopic topic modeling

Topic modeling provides a way to generative

- bag of words

- decomposition into two low-dimensional matrices for doc-topic distribution and word-topic distribution, respectively

- LDA and extensions of it (CTM, HDP, GLDA, DTM) are broadly adopted in topic modeling (Muchene and Safari, 2021)

Research gaps and opportunities:

- The scarcity of studies that use statistical methods for unstructured data in urbanism education

- Theses are representative outputs of educational programs that can be used as data for text mining. The growing availability of theses in digital repositories presents an opportunity to that end. The TU Delft repository was established in 2007, in the year when the EMU program started.

- Applications of topic modeling in the field of urbanism

- Patterns revealed in past education can potentially better inform future decisions in education in the field

- The EMU program…

Challenges:

Contribution:

- This paper showcases reproducible research workflow. It is part of a reproducible research compendium and accompanied by a published dataset. The analyses presented in this paper were carried out in the free and open-source statistical programming software R (R Core Team, 2023). The research compendium is available at [ADD CITATION], the data is published in th 4TU.ResearchData repository [ADD CITATION] and it is available for exploration in a Shiny dashboard at [ADD LINK]

- Give an overview of th predominant topics and their evolution over the years of the EMU program. In addition to the natural document classification of documents provided by a repository, LDA allows documents to be part of multiple topics (Muchene and Safari, 2021).

The following section describes the case study data, pre-processing steps and the topic modeling workflow.

Methods

Research questions:

- What were the main topics addressed in the EMU program?

- How did those topics evolve throughout the duration of the program between 2007-2021?

- To what extent were the topics and evolution thereof influenced by the assignments given to the students throughout their studies leading up to their thesis?

- To what extent were the topics and evolution thereof influenced by the exchange semester followed by the students?

  - Use LDA clustering with 3 classes (corresponding to the three exchange universities) to see how well the clustering is aligned with where the student carried out their exchange semester. Use a confusion matrix to visualize the relation between real values and values assigned through clustering.

Data

Of the total of 96 theses published in the EMU program, full-text documents were available and permissions were granted for 83 . Metadata was downloaded from the TU Delft Education Repository or obtained from the EMU program coordination records when unavailable on the repository. The full-text documents were obtained either from the TU Delft Education Repository (an API for downloading a large set of full-text data is not available), when available, or from the authors via email. Even though repository entries are open access, it was unclear if the content of the theses can be mined. Considering the relatively small size of the corpus and the possibility of directly contacting the alumni network, permissions were requested individually. Only PDFs for which permission was obtained were included in the corpus.With the exception of a bilingual English-Spanish thesis, all thesis were written in English. The theses are available in PDF format with complex layouts typical to an urbanism project in which text and various types of graphics are combined. **?@tbl-data** gives an overview of the data included in the analysis.

The imported dataset contains the text data in the `text` column and related metadata in the other columns…

For each thesis, henceforth referred to as "document", the metadata consisted of the ID, `title`, `graduation_year`, `graduation_semester`, `exchange_semester`, `location`, `latitude`, `longitude`, `abstract`, `text_raw` and `text_clean` .

Both the raw and cleaned data are published in the 4TU.ResearchData repository [ADD CITATION].

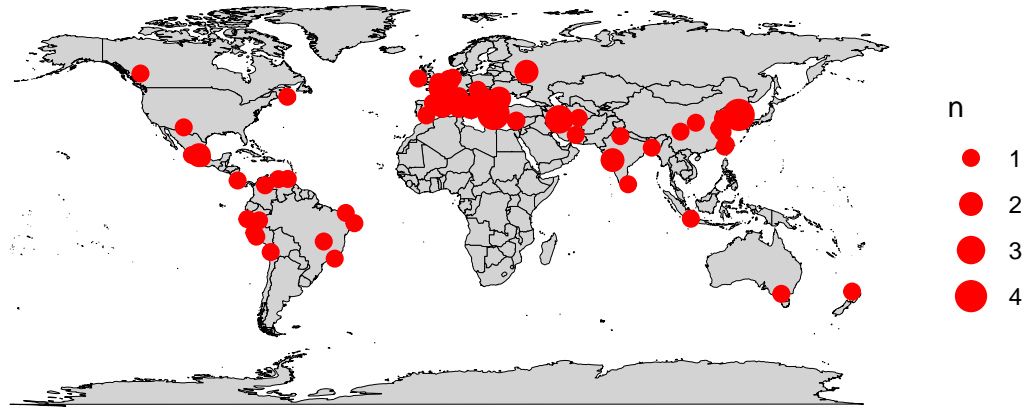

Figure 1: Location of EMU theses included in the analysis

Figure 1 shows the geographic spread of the theses included in the analysis.

Data analysis

Pre-processing

Word-level tokenisation was applied with the `unnest_tokens()` function of the `tidytext` package. This was preferred over other tokenisers as it produced results that work seamlessly with other `tidyverse` tools used in the analysis. `unnest_tokens()` removes punctuation, converts to lower-case, and separate all words into individual tokens.

Bigrams such as "public space" and trigrams such as "socio-spatial segregation" identified during preliminarey EDA were concatenated by replacing white spaces with underscores.

For analyses in which word-level tokens were used, stop words, i.e., common words or words that do not add much meaning, were removed in the pre-processing stage. Global, subject-specific and document stop words (Hvitfeldt and Silge, 2021) were differentiated. As all theses were written in English, the pre-made "snowball" lexicon was used to remove global stop words. We manually constructed a list of subject-specific stop words based on our domain knowledge. Words that are commonly used to structure a theses, such as "preface", "contents", and "introduction", were added as subject-specific stop words as well. Finally, titles and author names were removed as document stop words. In the next pre-processing step, we normalised the resulting words, that is, reduced them to their canonical dictionary forms, the resulting words were lemmatised (Hvitfeldt and Silge, 2021). Lemmatisation was preferred over stemming as the former tends to be more meaningful and less degrading than the latter.

```r
meta_sw <- find_meta_stopwords(emu)
urbanism_sw <- urbanism_stopwords(
    add_stopwords = c("emu", "european postgraduate master in urbanism",
                      "european post master in urbanism",
                      "european postmaster in urbanism",
                      "tu delft", "ku leuven", "upc barcelona", "iuav venice"))
thesis_sw <- thesis_stopwords(add_stopwords = c("advisor", "prof", "fig", "ure", "ning"))
ananymisiation_sw <- c("EMAIL_REMOVED", "AUTHOR_REMOVED", "FIRST_NAME_REMOVED", "LAST_NAME
  paste(collapse = "|")
custom_sw <- c("space", "spatial", "spaces", "plan", "public", "development") |>
  (\(.) paste0("\\b", ., "\\b"))() |>
  paste(collapse = "|")

# Add cleaned text column
emu$text_clean <- emu$text_raw |>
  # Remove white spaces and punctuation, and change text to lower-case
  clean_basic() |>
  # Remove title, subtitle and full title
  str_remove_all(meta_sw) |>
  # Remove dataset-specific words
  str_remove_all(urbanism_sw) |>
  # Remove thesis-specific words
  str_remove_all(thesis_sw) |>
  # Remove text included with anonymisation
  str_remove_all(ananymisiation_sw)

# Concatenate ngrams
system.time(
  emu$text_clean <- emu |>
    c_ngrams(n_max = 3, text_col = "text_clean",
```

```
                 title_col = "title", min_freq = 20, lemma = TRUE)
  )

    user    system  elapsed
1487.532     5.422 1504.414

  # Words that were not included in ngrams are safe to remove now
emu$text_clean <- emu$text_clean |>
  str_remove_all(custom_sw)

# TODO Replace title column with ID column

# Unnest tokens and remove words of one and two letters
emu_words <- emu |>
  select(title, text_clean) |>
  unnest_tokens(output = word, input = text_clean) |>  # remove punctuation, convert to lo
  anti_join(tidytext::stop_words, by = "word") |>  # remove stop words
  mutate(word = textstem::lemmatize_words(word)) |>  # lemmatise words
  filter(nchar(word) >= 3)  # keep only words that are at least three letters long
```

Finally, additional checks were made to the document in search for previously undetected stop words. Short words of one and two letters could be safely removed, while three-letter words were kept, as many of those, including "map" and "low", were meaningful and occurring in high frequency.

Topic model

Similar to clustering on numeric data, topic modelling is a method of unsupervised classification of topics found in a group of documents (Silge and Robinson, 2017). We used the Latent Dirichlet Allocation (LDA) algorithm for topic modeling. In LDA, each document is a mixture of topics and each topic is a mixture of words. The probability of a term being part of a topic is given by the β (beta) statistic, while the probability of a document being part of a topic is given by the θ (theta) statistic.

LDA is a Bayesian generative topic model which assumes that each topic is a distribution over words and each document is a distribution over topics (Blei, 2012; Blei et al., 2003; Grün and Hornik, 2011).

Latent topics are measured as patterns of word co-occurrence

Describe model parameters:

- collection of M = 83 documents

- corpus D

- N = 947139 words

- vocabulary of V = 61770 words

Determining tuning parameters:

- The number of topics was qualitatively determined

LDA requires a document-term matrix as input.

```
# What is the dominant topic in each document?
N = 20
topic_prop_examples <- theta[1:N,]
colnames(topic_prop_examples) <- topic_names
# TODO change to pivot_longer
vizDataFrame <- melt(cbind(data.frame(topic_prop_examples),
                          document = factor(rownames(topic_prop_examples))),
                     variable.name = "topic", id.vars = "document")

Top 50 most used words in the corpus of theses
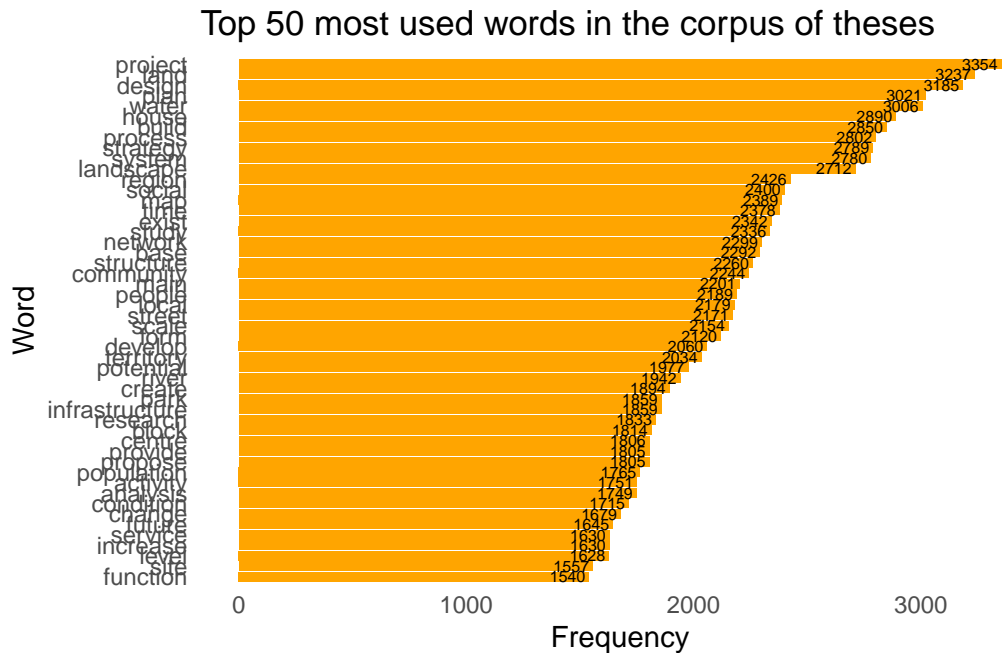

A frequency count of ngrams reveals collocations like "public space" or "socio-spatial segregation" across the corpus. To include these in the topic model, we concatenated them with an underscore, so that they are considered one word during the word-level tokenisation. Only bigrams and trigrams, that is two- and three-word collocations, were extracted from the corpus.

  facet_wrap( ~ title, scales = "free", ncol = 2) +
  theme(legend.position = "none")
```

Count of unique words found in thesis

Stop words were removed from the list
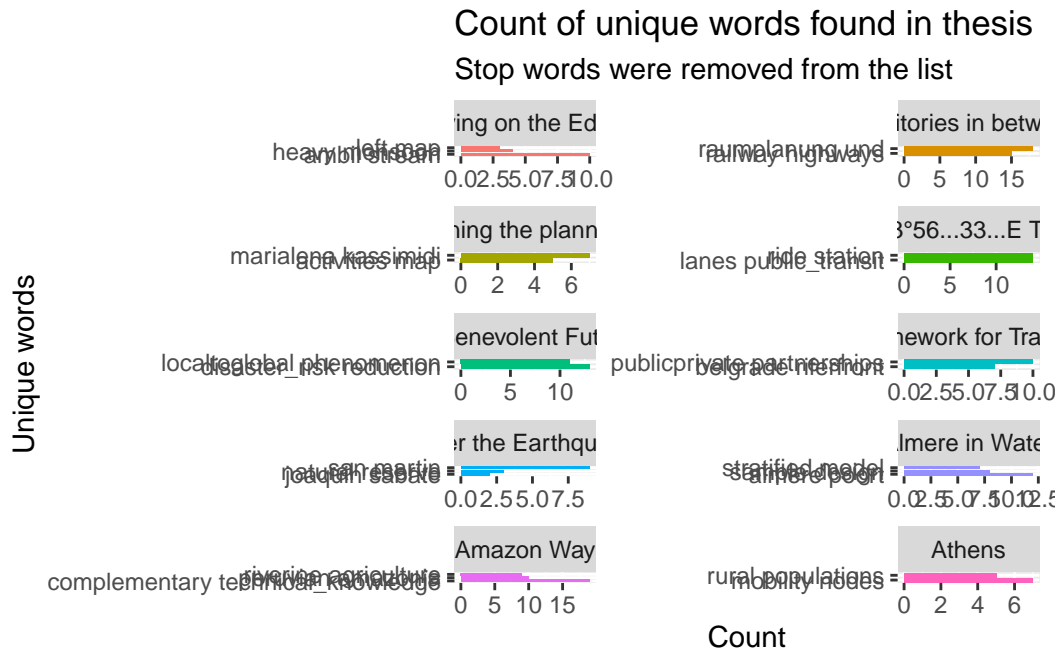

The `tf-idf` statistic shows words that are the most important to one document in a collection of documents (Silge and Robinson, 2017). In this case, it shows high values for the names of thesis locations that tend to be high-frequency thesis-specific words.

```r
## Calculate tf-idf statistic
emu_tf_idf <- emu_words |>
  get_tf_idf(title_col = "title", word_col = "word")

## Get top n words most specific to each thesis
emu_tf_idf |>
  group_by(title) |>
  top_n(5, tf_idf) |>
  arrange(desc(tf_idf), .by_group = TRUE)
```

```

Word embeddings

[Describe word embeddings …]

The high-dimensional sparse matrix of word features is projected into reduced, 100-dimensional set of features.

```r
# Determine word vectors using SVD, a method for dimensionality reduction
tidy_word_vectors <- tidy_pmi |>
  widely_svd(
    item1, item2, pmi,
    nv = 100, maxit = 1000
  )
```

[What terms should be checked with the function below?]

```r
# Calculate nearest neighbours of a given word
tidy_word_vectors |>
  nearest_neighbors("resilience")
```

```
# A tibble: 4,020 x 2
   item1             value
   <chr>             <dbl>
 1 resilience        1
 2 adaptability      0.630
 3 disaster          0.551
 4 sustainability    0.531
 5 stability         0.522
 6 social_resilience 0.515
 7 engineering       0.485
 8 resilient         0.482
 9 stress            0.475
10 environmental     0.474
# i 4,010 more rows
```

The first [?] components... [what do they show?]

```r
# The first n components with top words found in the corpus of theses
visualise_first_n_components(tidy_word_vectors, 24, 12)
```

First 24 principal components for text of theses

Top words contributing to the components that explain the most variation

Value
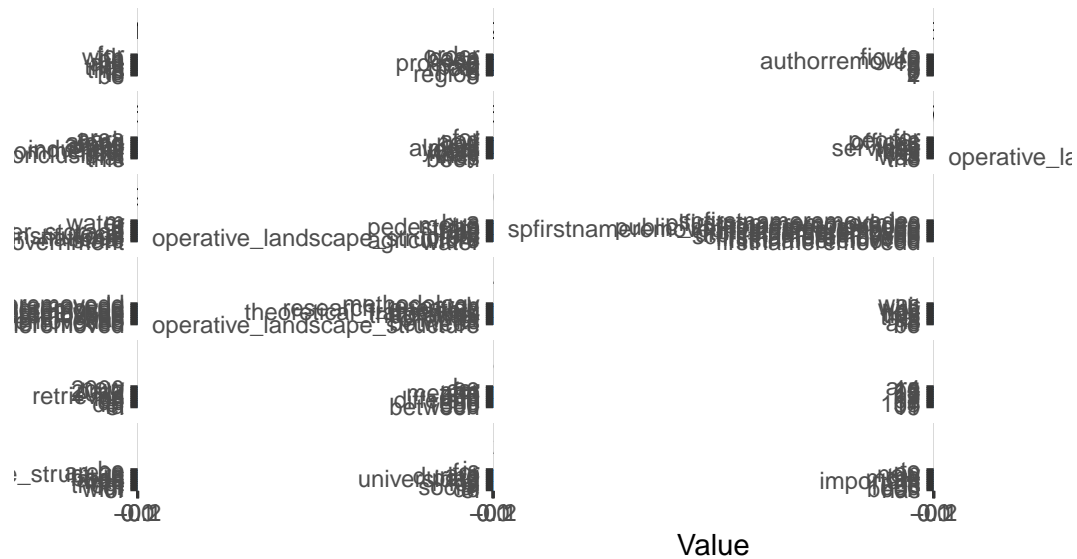

```r
tidy_words <- emu |>
  select(title, text_clean) |>
  unnest_tokens(word, text_clean) |>
  add_count(word) |>
  filter(n >= 50) |>
  select(-n)

# Summarise word embeddings into document embeddings for modeling purposes
word_matrix <- tidy_words |>
  count(title, word) |>
  cast_sparse(title, word, n)

embedding_matrix <- tidy_word_vectors |>
  cast_sparse(item1, dimension, value)

doc_matrix <- word_matrix %*% embedding_matrix

dim(doc_matrix)
```

```
[1]  82 100
```

```
doc_matrix

Discussion

- Although the focus of this study is on describing a fixed corpus though unsupervised machine learning, it can provide input into supervised predictive models.

Conclusion
